Send a WhatsApp broadcast

5 steps · about 4 min

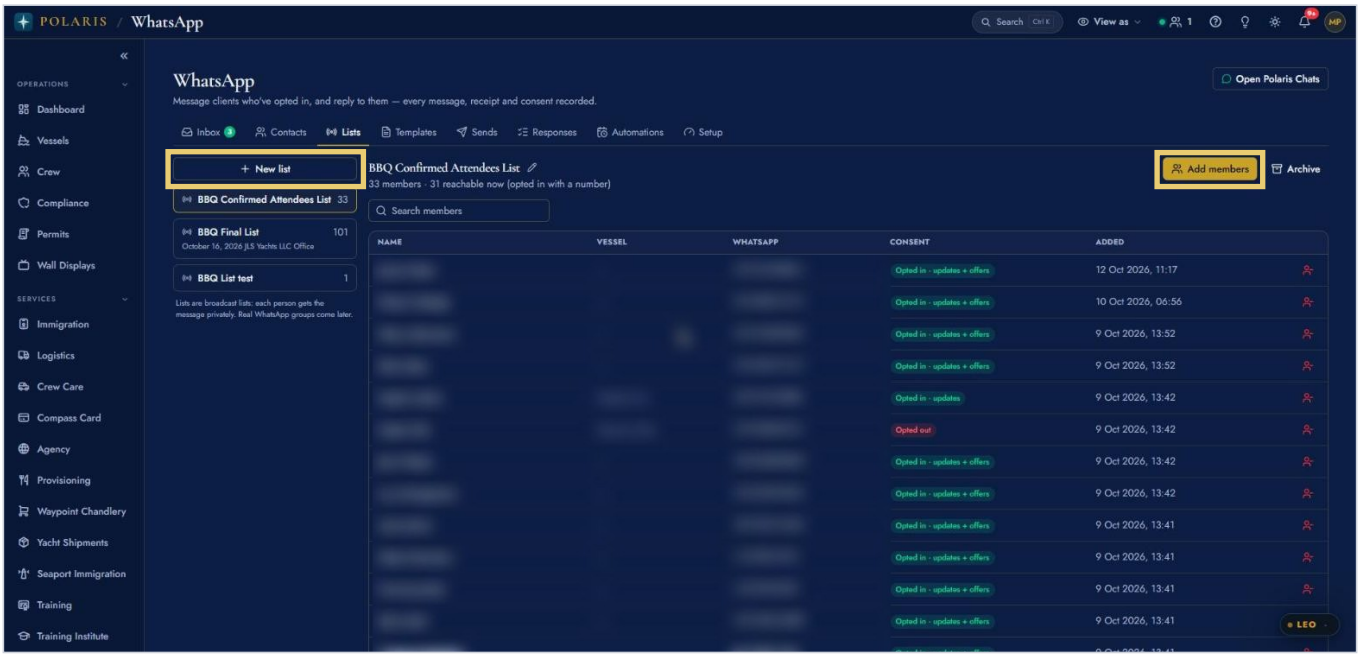

Build a broadcast list of opted-in contacts and send them an approved template message.

1 Make sure contacts have opted in

On **Contacts**, add people with **Add contact** and record their consent (the shield icon -> **Record consent**, saying how they agreed). Only contacts who have opted in are messaged — opt-outs are respected automatically.

2 Create a list

On **Lists**, click **New list**, give it a name, then **Add members** — tick **Opted in only** and choose the contacts. Each person gets the message privately; it isn't a group chat.

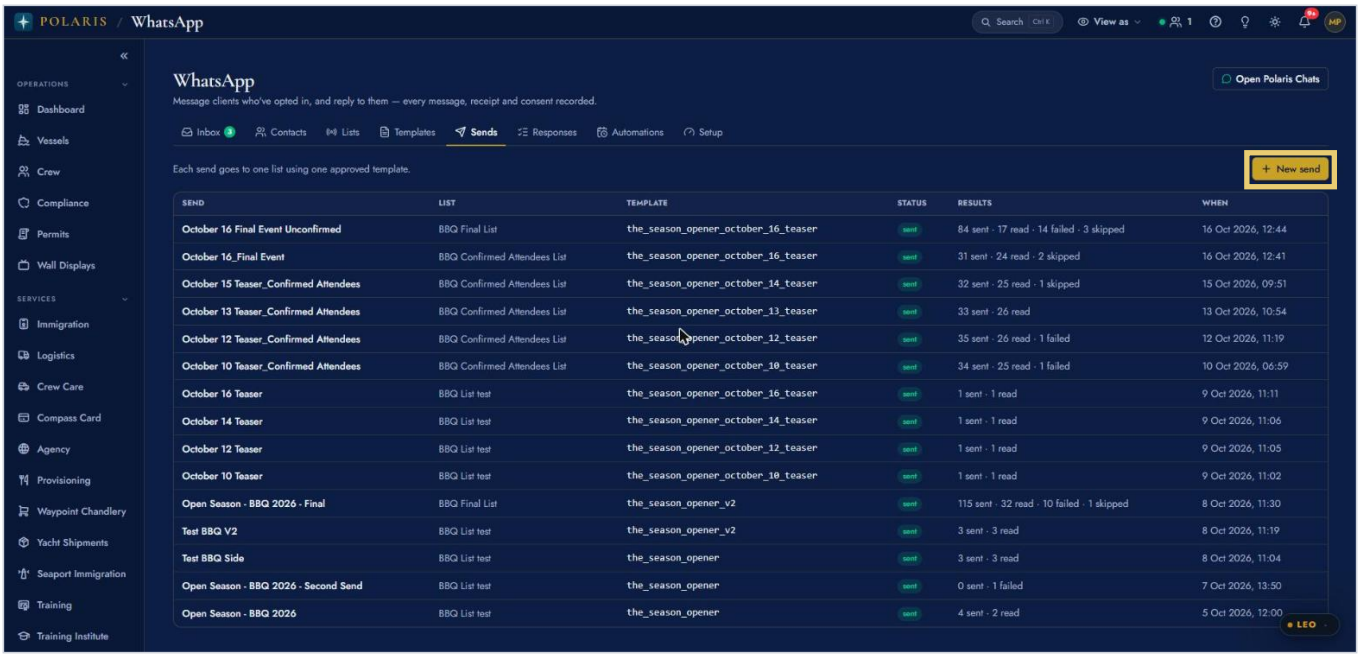

3 Choose an approved template

Broadcasts must use a template Meta has approved. On **Templates**, **New template** creates one (name, message, optional header, footer and buttons) — save it as a draft, then **Submit to Meta** for review.

4 Create the send

On **Sends**, click **New send**. Name it and choose the **List**, the **Template** and any values or files it needs, then **Save draft**. Nothing goes out yet — you see who it will reach first.

5 Send and check the results

Open the draft and click **Send to N**, then confirm — this can't be recalled. The **Sends** list then shows how many were sent, read, failed or skipped, and **Download list** saves the responses.
